Identifying compounds that alter inhibition of cone opsin kinase polypeptide activity for treating a conditions related to cone visual signaling, comprises mixing a compound with a cone opsin kinase and w inhibitory polypeptide with

Example 4; Page 45-46; 61pp; English.

CC Outpled receptor kinase 7; GRK7) and their corresponding polynucleotides. CC coupled receptor kinase 7; GRK7) and their corresponding polynucleotides. CC The invention further relates to a method of identifying compounds that CC alter the inhibition of GRK7 polypeptide activity which involves mixing a CC test compound with GRK7 protein and an inhibitory polypeptide and CC determining if the test compound alters the inhibition of GRK7 protein CC circating conditions related to cone visual signalling (e.g., night CC blindness, colour blindness, difficulty with colour vision, visual sensitivity, visual resolution or in adapting to changes in light CC blindness, Oguchi disease or dominant congenital stationary night CC blindness), Pineal gland activity (e.g., chromobiological desynchrony, CC depression, anxiety, mental fogginess, memory loss, headaches, fatigue, CC or jet lag). Agonists of GRK7 polypeptide activity may be used to treat CC or ameliorate symptoms of a disease for which increased GRK7 polypeptide activity is beneficial, e.g., decreased colour sensitivity or other cone photoreceptor-mediated diseases. The GRK7 proteins are also useful in the CC probes to screen for inherited defects in colour vision, circadian rhythm and vision resolution. They are also used as gene therapy tools for

contenting libraries and assessing gene expression patterns. The nucleotides of the invention are also useful in drug screening and gene therapy for the modulation of GRK expression. The nucleotides of the invention can be used to genetically engineer host cells to express GRK products in vivo. The nucleotide sequences of the invention are also useful in addressable arrays for identifying and characterising the temporal and tissue specific expression of a gene and in microarrays to screen collections of genetic material from patients who have a particular medical condition. The proteins of the invention are useful compensating antibodies, as reagents in diagnostic assays, for identifying other cellular gene products related to GRK, and as reagents in assays for screening for compounds that are useful in the treatment of mental, biological or medical disorders/diseases Matches 1659; Query Match The present cDNA sequence encodes a human G-protein coupled receptor kinase (GRK), also designated NHP (novel human protein) in the specification, which is claimed in the invention. The invention comprises novel human nucleotide and protein sequences which have similarity to G-protein coupled receptor kinases. Oligonucleotides derived from the nucleotides of the invention are useful as hybridisation probes for New polynucleotides encoding human proteins that share sequence similarity with animal kinases e.g. G-protein coupled receptor kinases, useful for drug screening, diagnosis and in gene therapy of biological WPI; Sequence 1662 BP; 420 A; 410 C; 479 G; 352 T; 0 U; 1 Other; Claim 1; Page 30; 34pp; English. The invention relates to human kinase proteins that are related to G-CC protein coupled receptor kinase subfamily. Human kinase gene is located CC on chromosome 3. The kinase peptide and nucleic acid are useful in the CC development of human therapeutic and diagnostic compositions. The peptide CC valuable to the field of pharmaceutical development to identify and CC characterise modulators of the kinase. The proteins may also be used to CC raise antibodies or to elicit an immune response, as a reagent in assays CC designed to quantitatively determine levels of the protein in biological CC fluids and as markers for tissues in which the corresponding protein is preferentially expressed (either constitutively or at a particular stage CC fitssue differentiation or development or in a disease state). The CC kinase proteins are also useful for providing a target for diagnosing a CC disease or predisposition to disease mediated by the peptide. The nucleic acid molecules are useful for probes, primers, chemical intermediates and CC containing the gene regulatory regions of the nucleic acid molecules and cCC containing the gene regulatory regions of the mucleic acid molecules and cCC acid expression. The present sequence is human kinase cDNA expressed in CCC skins, germinal center B cells, colon, kidney and lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                          New isolated human kinase proteins and nucleic acids, useful as a major target for drug action and development, particularly for screening modulators of the kinase peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; kinase; G-protein coupled receptor kinase; tissue differentiation; chromosome 3; therapeutic; immune response; drug screening; enzyme; ss.

CC AAS06701-AAS06757 encode for novel human protein kinases #1-57. The novel CC protein kinases have been identified as members of the tyrosine or serine/threonine kinases (PTK and STK) families. The polynucleotides CC encoding protein kinases and the polypeptides may be used in the CC prevention, diagnosis and treatment of diseases associated with CC inappropriate kinase expression. For example, they may be used to treat CC cancers (especially cancers of haematopoietic origin), cardiovascular CC immune related diseases (e.g. rheumatoid arthritis), neurological disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. diseases (e.g. schizophrenia), neurodegenerative disorders (e.g. disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious CC disease (e.g. HIV) and reproductive disorders (e.g. infertility). Additionally, polynucleotides encoding protein kinases may be used for CC gene therapy and as DNA probes in diagnostic assays. The protein kinase CC against the protein kinases and in assays to identify modulators of nrorein kinase expression and activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plowman GD,
Flanagan P,
                                    protein kinase expression and activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding human kinase polypeptides, useful for preventing diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Fig 1; 433pp; English.

The present sequence encodes a human G protein-coupled receptor kinase (CRK) protein (I). (I) has cytostatic, antidiabetic, neuroprotective, CC nootropic, cardiovascular, anti-Parkinsonian, cardiant, vasotropic and CC antiasthmatic activities, and can be used in gene therapy. (I) can be CC regulated to treat cancer, diabetes, a central nervous system (CNS) CC disorder (e.g. anxiety or mood disorders, Alzheimer's disease and CC Parkinson's disease), cardiovascular disorders (e.g. congestive heart CC failure, myocardial infarction, ischaemic diseases of the heart or CC hypertensive vascular disease), asthma and chronic obstructive pulmonary CC disorder (COPD). GRK molecules are useful in screening for agents that CC regulate or decease the activity of a GRK. GRK sequences may also be used CC and abnormalities related to the presence of mutations in the nucleic acid sequences that encode the GRK enzyme

present

invention relates to novel

human

cone opsin

kinase

(G-protein

CC coupled receptor kinase 7; GRK7) and their corresponding polynucleotides. CC The invention further relates to a method of identifying compounds that CC alter the inhibition of GRK7 polypeptide activity which involves mixing a CC test compound with GRK7 protein and an inhibitory polypeptide and CC determining if the test compound alters the inhibition of GRK7 protein CC activity by the inhibitory polypeptide. GRK7 sequences are useful for CC treating conditions related to cone visual signalling (e.g., night CC blindness, colour blindness, difficulty with colour visual cC intensity, Oguchi disease or dominant congenital stationary night CC intensity, Oguchi disease or dominant congenital stationary night CC blindness), Pineal gland activity (e.g., chronobiological desynchrony, CC depression, anxiety, mental fogginess, memory loss, headaches, fatigue, CC or jet lag). Agonists of GRK7 polypeptide activity may be used to treat CC or ameliorate symptoms of a disease for which increased GRK7 polypeptide activity is beneficial, e.g., decreased colour sensitivity or orther cone photoreceptor mediated diseases. The GRK7 proteins are also useful in the CC probes to screen for inherited defects in colour vision, circadian rhythm CC and vision resolution. They are also used as gene therapy tools for CC spilce variant CDNA splice variant cDNA

                                                                                                                                                                                                       screening libraries and assessing gene expression patterns. The nucleotides of the invention are also useful in drug screening and gene therapy for the modulation of GRK expression. The nucleotides of the invention can be used to genetically engineer host cells to express GRK products in vivo. The nucleotide sequences of the invention are also useful in addressable arrays for identifying and characterising the temporal and tissue specific expression of a gene and in microarrays to screen collections of genetic material from patients who have a particular medical condition. The proteins of the invention are useful for generating antibodies, as reagents in diagnostic assays, for identifying other cellular gene products related to GRK, and as reagents in assays for screening for compounds that are useful in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present cDNA sequence encodes a human G-protein coupled receptor kinase (GRK), also designated NHP (novel human protein) in the specification, which is claimed in the invention. The invention comprises novel human nucleotide and protein sequences which have similarity to G-protein coupled receptor kinases. Oligonucleotides derived from the

            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
